

Potassium plays an important role in the photosynthesis and food production processes within the plant, in the enzyme action of the plant, in increasing resistance to lodging and in the disease resistance mechanism of the plant. Thus it is closely connected with the quality of the plant.

If potassium becomes limiting, it is most commonly where rainfall is high, where intensive cropping or grazing has been practiced, where frequent hay or silage cuts have been taken or where other nutrient deficiencies have been overcome.

Deficiency is more likely to occur in sandy soils than in clay soils, and in many coastal areas.

RUTEK PK 10-25 can be applied either as a foliar spray or direct to the soil or pasture.
